DESCRIPTION:

This completely updated 4th edition now includes two volumes: it retains the easy-to-use handbook format of the previous successful book, while fulfilling the need for a review of the content. Taking into consideration recent advances in systemic and topical treatments, state-of-the-art lasers, and the latest evidence-based recommendations, it now includes biologic agents for psoriasis and their use as off-label treatments in other skin disorders, targeted agents for malignant melanoma and basal cell carcinoma, and new treatment modalities for rosacea, acne, atopic dermatitis, and urticaria, to name but a few. The European Handbook of Dermatological Treatments provides concise, up-to-date overviews of treatment guidelines and clinical pearls for a large number of skin diseases. It is divided into three main sections addressing the many different skin diseases, the drugs available for dermatological treatments, and the various methods applied in dermatology, including fillers, botulinum toxin, lasers, dermoscopy, cryosurgery, and electrosurgery. Written by a recognized expert in the field, each chapter focuses on a particular skin disease, illustrating current treatments while providing a brief synopsis of the etiology and clinical presentation of the disease. Treatment indications and contraindications, modes of action, and dosages are clearly identified and the content is enhanced by a wealth of clinical pictures and tables, making it an engaging tool for professionals, and a valuable learning resource for young practitioners, as well as postgraduate students and residents.
